

WAS YOUR BABY BORN WITH AN EAR DEFORMITY?

WE CAN HELP

Did you know that almost 1 out of 3 babies are born with an ear deformity? If your baby is one of them, make an appointment to speak with one of our medical providers and learn about a new and innovative option for your baby.

There are different types of ear deformities such as lop ears, constricted ears, prominent ears, and Stahl's ears, that appear elf-like or flat. These deformities do not cause any functional hearing loss, however they can cause years of emotional stress and bullying, especially during childhood and adolescence.

Our office now offers InfantEar™, a surgical-free and painless ear molding treatment that can permanently transform your baby's ears in just 3 weeks, if started in the first 2 weeks of life. The good news is, that in many cases, this procedure is covered by your insurance.

DON'T WAIT

If your newborn infant appears to have deformed ears, ask us about getting your infant evaluated for this innovative and effective ear molding procedure. Maternal estrogen makes baby ears malleable for the first 6 weeks of life. For best results and shortest duration of treatment, InfantEar™ molding should begin in the first weeks of life.
